Flow control of data link layer using window protocal

AIM:
To write a program to implement flow control at the point data link layer using the sliding window protocol and simulate the layer flow of fame afrom one node to another

Algorithm:

1. Start the program
2. Read the total no. of frames, sender window size, the frame number is cost.
3. Initialize base=0 and next seq=0
4. Determine base =0, and Send window ~~next seq~~
5) Send all frames within the current discord
6). If there is no loss, the reciave accept the frames and send ACKs

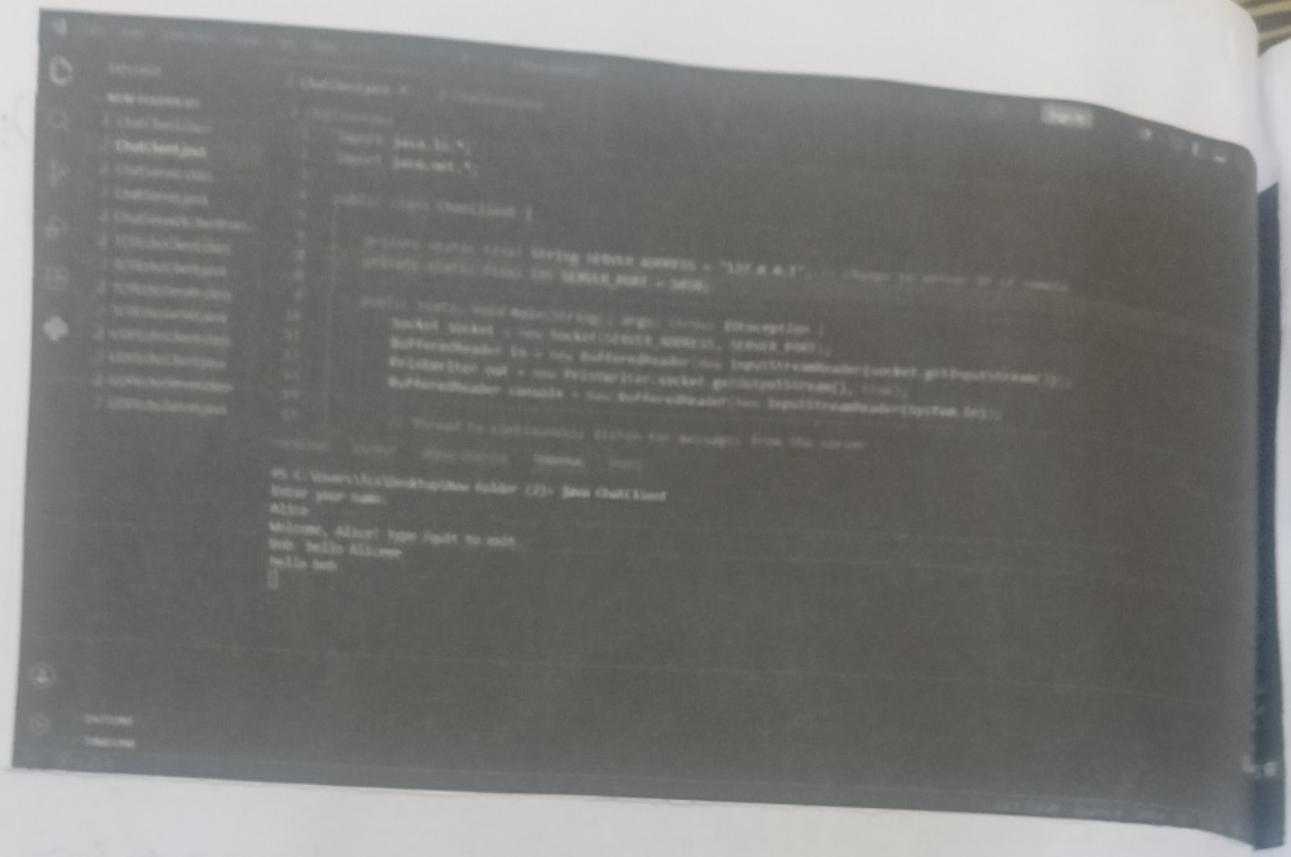

PROGRAM

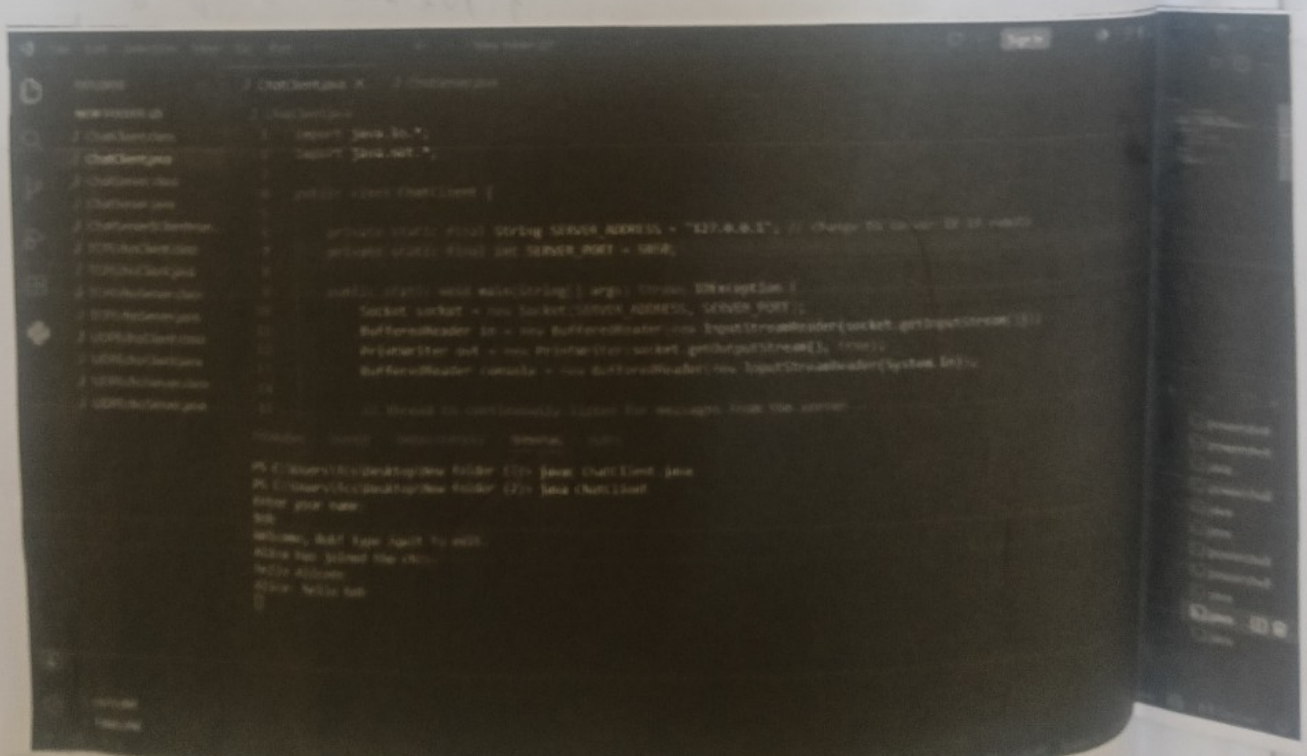

```
def simulate(Total_Frame, lost_frame):
    base = 0
    next_seq = 0
    while base < total_frames:
        window_end = min(base + window_
                         size - 1)
    total_Frame == 1)

while next_seq < base + window size
    and next_seq < total_frames:
        print("f Node A → sending frame
              { Next_seq }")

    if next_seq == lost_frame:
        print(Frame { next_seq }

def main():
    windowsize = int(input("Enter
                 sendus windows size:")
    if Last_Frame == 1:
        lost_Frame = None
    simulate(total_Frame, windows
             Last_frame)
```

if __name__ == "__main__":
    main()

11.
One program to implement flow control at data link layer using the Sliding window was written, executed Node(A) and node(B)
